METHOD AND SYSTEM FOR ROUTING COMMUNICATIONS AMONG COMPUTER NETWORKS

ABSTRACT OF THE DISCLOSURE

A method and system for determining route redistribution are disclosed.

5 The method generally comprises receiving an information packet from a neighbor

source. The information packet identifies the source as a stub router and specifies

route types that the source will advertise. Upon receiving notice of a failed link

within the network, query packets are sent only to neighboring devices that have

not been identified as stub routers to request route information.
